How to Read and Use This Data: A Simple Guide

Evan Wesley - Vivi The Physics Slayer!

October 1, 2025

This dataset presents a compact, integer-based encoding of fundamental physical constants—structured like a **"Periodic Table of Constants."** All values are derived from whole numbers and modular arithmetic, revealing hidden patterns and enabling exact reconstruction.

The Core Idea

Every physical constant is approximated by a large integer k (its "atomic number") scaled by a Circular Ball/Universal quantum unit U:

$$\text{Constant} \approx k \cdot U$$

where the Circular Ball/Universal unit is defined as:

$$U = \frac{1}{49 \cdot 50 \cdot 137^6}.$$

Most entries use depth $p = 6$, meaning the denominator includes 137^6. A few (e.g., the upper bound on $\bar{\theta}_{\text{QCD}}$) use higher depth and are noted accordingly.

This formulation allows physical constants to be represented exactly as integers, with extremely small relative errors (often below 10^{-15}).

The Two Tables

1. Master Table (`Output Data EZ Read.txt`)

This table lists the encoded constants:

Sector: Category of the constant (e.g., `CORE`, `CKM`, `HIGGS/YUKAWA`)

Symbol: Standard physics notation

Value: Experimental or best-fit numerical value

k **(Atomic Number)**: The integer that encodes the constant

Relative Error: Accuracy of the approximation $k \cdot U$ vs. the true value

Sector	Symbol	Value	k (Atomic Number)	Relative Error

2. DNA Fingerprint Table (`Output Data (DNA) EZ Read.txt`)

This table provides the modular "fingerprint" of each k:

Residue (mod 23, 49, 50, 137): The tuple (k mod 23, k mod 49, k mod 50, k mod 137)

This 4-number signature acts as a unique identifier—useful for detecting algebraic relationships, symmetries, or families among constants

Sector	Symbol	Residue (mod 23, 49, 50, 137)

Why This Format Is Useful

Enables **exact arithmetic** with physical constants using only integers

Reveals **number-theoretic structure** in the Standard Model parameters

Simplifies **reproduction, validation, and extension** of the dataset in code

Facilitates pattern searches via **modular residue comparisons**
To reconstruct any constant: multiply its k by U.
To explore relationships: compare residue tuples across sectors.
